## ACKNOWLEDGEMENT

We wish to take this opportunity to express our sincere gratitude and deep sense of respect to our beloved **Dr. P. PRASAD RAO**, Principal, Vaagdevi Engineering College for making us available all the required assistance and for his support and inspiration to carry out this UG Project Phase-1 in the institute.

We extend our heartfelt thanks to **Dr. R. NAVEEN KUMAR**, Head of the Department of CSE, Vaagdevi Engineering College for providing us necessary infrastructure and thereby giving us freedom to carry out the UG Project Phase-1.

We express heartfelt thanks to Smart Bridge Educational Services Private Limited, for their constant supervision as well as for providing necessary information regarding the UG Project Phase-1 and for their support in completing the UG Project Phase-1.

We express heartfelt thanks to the guide, **Ms. B. AMBIKA** Assistant professor, Department of CSE for his constant support and giving necessary guidance for completion of this UG Project Phase-1.

Finally, we express our sincere thanks and gratitude to my family members, friends for their encouragement and outpouring their knowledge and experience throughout the thesis.

## **ABSTRACT**

Forecasting or Predicting the sale value helps the investors to invest in such a time where profits can be maximum. This project provides guidance to individuals who are willing to invest or buy a car and help them in knowing the price of a day using the prophet library. It is built on the monthly sales data from 1960 - 1968. Time series analysis is made on the data for accurate predictions.

# **1. INTRODUCTION**

## **1.1 Introduction**

Any data associated with the time that is dependent on time-related matters can be termed as time-series data. In such type of data, we can see trends, nonstationarity, and seasonality based on a daily, weekly, yearly basis. This type of data is adversely affected when any of these above parameters are hampered. Now, being a data scientist who is involved in the analysis of time series it is his/her duty to analyze the data and then make valuable predictions out of it so that the same can be used as a benchmark model to make future predictions or forecastings.

The answer to this question is the Facebook Prophet library. This was launched by Facebook as an API for carrying out the forecasting related things for time series data. The library is so powerful that it has the capability of handling stationarity within the data and also seasonality related components. By stationarity, we mean that there should be constant mean, variance, and covariance in the data if we divide the data into segments with respect to time and seasonality means the same type of trend the data is following if segregated based on time intervals.

## **1.2 Overview**

Forecasting or Predicting the sale value helps the investors to invest in such a time where profits can be maximum. This project provides guidance to individuals who are willing to invest or buy a car and help them in knowing the price of a day using the prophet library. It is built on the monthly sales data from 1960 - 1968. Time series analysis is made on the data for accurate predictions.

## **1.3 Purpose**

In our article we'll try to explain how time series analysis forecasting methods can be used for typical business tasks: finding hidden patterns, detecting trends in sales over the years, predicting sales over the years, and predicting sales in the future. This library offers a number of parameters to play around with and tune our model with higher efficiency for eg. specifying holidays, daily seasonality, Fourier transformations, etc. So, without wasting much time let's take a look at this library by implementing the same with the help of Python.

## **2.LITERATURE SURVEY**

### **2.1 Existing Problem**

Seher Arslankya in his research paper implemented time series analysis and artificial neural network methods to estimate sales for future months for the leading company in the automotive industry in Turkey. He examined the monthly data between January 2011 and July 2016 using multiple regression, moving average and artificial neural network model. Furthermore, he compared MAPE values for all models, which resulted in the ANN model giving the best result. Arnis Kirshners did a comparative analysis of short time series processing methods intending to scrutinize these methods' ability to be used when analyzing short time series. The author has analyzed the moving average Method, exponential smoothening, and exponential smoothening with development trends resulting from moving average having the smallest squared error value but with large forecast smoothening for initial data. Shamsul Masum elucidates on time series forecasting and its classification and approaches and strategies of time series forecasting. Furthermore, the author has demonstrated how an inappropriate point to point rolling forecast strategy leads to unrealistic outcomes and supports his argument with a comparative analysis of Tamal Datta Chaudhuri proposed six different forecasting methods for predicting the time series index of the healthcare sector.

### **2.2 Proposed Solution**

The author has demonstrated a decomposition approach of time series for data from January 2010 to December 2016 and illustrated how the decomposition results provide us with useful insights into the and properties exhibited by time series. The author observed that results from the ARIMA model with a horizon of 12 months came out to be the best model with the lowest RSME value, while the Holt Winters method with a horizon of 12 months has the highest RSME value. Jaydip Sen, in his research paper, uses the Time series - decomposition based Method to analyze the past of the Indian realty sector and predict its future. He uses time series forecasting methods in R programming language to determine future results. He uses time series index value data of the Indian realty sector for six years from 2010-2016 month wise. The methods used for accurate predictions are: Holt Winters exponential smoothening and Autoregressive Integrated Moving Average. He analyses the results from the above-mentioned broad concepts and observes, which is the best one.

### **3.THEORITICAL ANALYSIS**

He analyses the results from the above mentioned broad concepts and observes, which is the best one. With the result obtained, he argues that these can be immensely useful for portfolio managers and stock traders to buy or sell stocks at the correct time. Samita sood elaborates how time series forecasting can be deployed in determining the future development of the Indian tourism industry from past secondary data. The author uses the data for the number of tourists in India from 1980 to 2020 and uses models such as ARIMA and Holt Winter to forecast foreign tourist travel and compare the two models' accuracy. On the basis of MAPE and RMSE, the authors conclude that Holt Winter is a more accurate model than ARIMA in this particular situation. William R Huss implements univariate estimation techniques such as Holt winter exponential smoothing, Multiple regression, Linear regression to study the load on 49 largest electric utilities in the United States and forecast the load for future planning.

The author uses electric utility data from 1972 to 1982, and the results indicate that for shorter periods, Holt Winters Exponential smoothing method is highly accurate, and for more extended periods, extrapolation of Linear regression horizons proves to be efficient. Deepa, in this paper, reviews, and forecasts the Indian Motorcycle market using Time series forecasting. The author uses SARIMA (Seasonal autoregressive Integrated Moving Method) and Holt Winters Method for prediction. The author compares several years' data and uses MAE and MAPE method to determine which model is more accurate and concludes that both the models are pretty significant but Holt Winters method is numerically more precise than the SARIMA model.

#### **Hardware /Software designing**

**Hardware requirement:** Laptop.

**Software requirement:** Python -3.6, Spyder, Jupyter Notebook, Anaconda Prompt, FbProphet.

## 4. EXPERIMENTAL INVESTIGATIONS

### Milestone 1: Data Collection

ML depends heavily on data, without data, a machine can't learn. It is the most crucial aspect that makes algorithm training possible. In Machine Learning projects, we need a training data set. It is the actual data set used to train the model for performing various actions.

You can collect datasets from different open sources like kaggle.com, data.gov; UCI machine learning repository etc. The dataset used for this project was obtained from Kaggle.

### Milestone 2: Data Pre-processing

Data Pre-processing includes the following main tasks

- Importing the libraries.
- Importing the dataset.
- Analyse the data.
- Taking care of Missing Data.
- Data Visualisation.
- Splitting Data into Train and Test.

### Milestone 3: Model Building

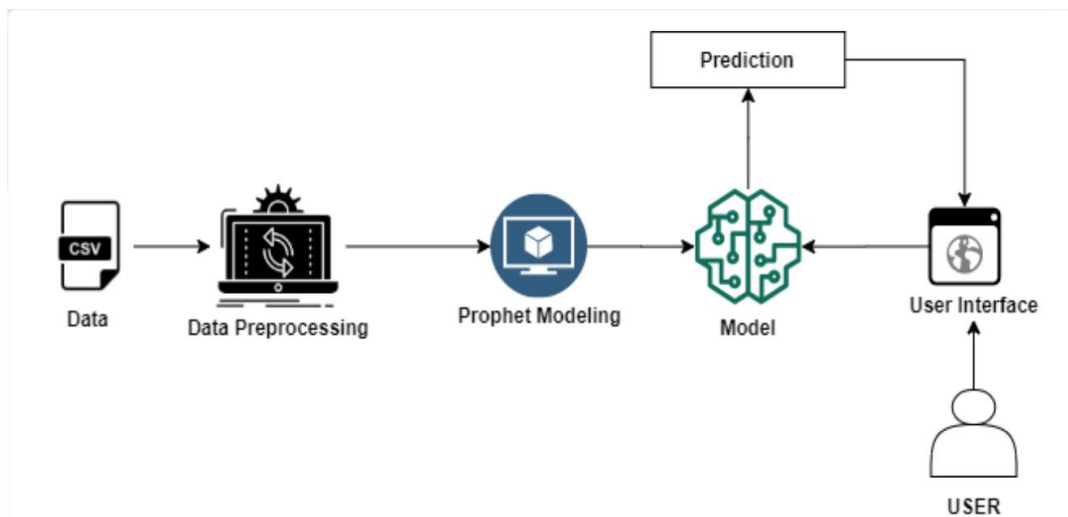

The model building process involves setting up ways of collecting data, understanding and paying attention to what is important in the data to answer the questions you are asking, finding a statistical, mathematical or a simulation model to gain understanding and make predictions. Model Building Includes:

- Import the model building libraries.
- Initialising the model.
- Training the model.
- Model Evaluation.
- Save the Model.

## Milestone 4: Application Building

- Create an HTML File.
- Build python code.
- Run the app in local browser.
- Show casting the prediction on UI.

### 4.1.PROJECT ARCHITECTURE

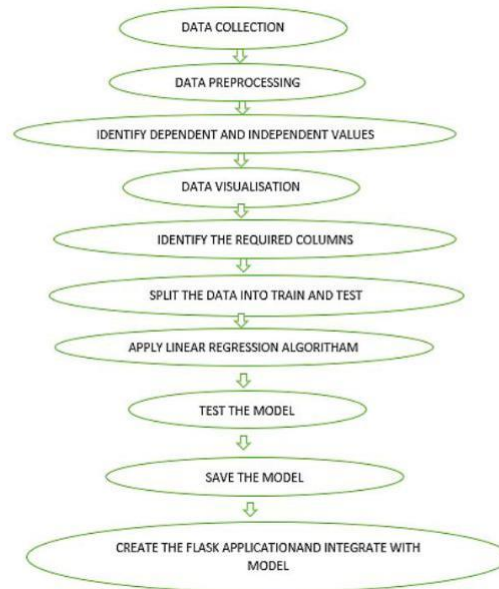

### Project Architecture

### PROJECT FLOW:

- User interacts with the UI (User Interface) to upload the input features.
- Uploaded features/input is analysed by the model which is integrated.
- Once a model analyses the uploaded inputs, the prediction is showcased on the UI.

## 5. DESIGN

### 5.1. FLOWCHART:

### Flowchart

## **6. CONCLUSION**

In UG Project Phase-1, we have worked on problem statement, literature survey and also done the experimental analyses which are required for the project to move forward. In experimental analysis we have discussed about the CNN concepts and models and explained the algorithms to be used in the project. Based on the experimental analysis we have designed the model for the project. Entire designing part is involved in UG Project Phase-1.

## **7. FUTURE SCOPE**

UG Project Phase-2 is the extension of UG Project Phase-1. UG Project Phase-2 involves all the coding and implementation of the design which we have retrieved from UG Project Phase-1. All the implementation is done and conclusions will be retrieved in the phase. We will also work on the applications, advantages, and disadvantages of the project in this phase. Future scope of the project will be also discussed in the UG Project Phase-2.

# 1. INTRODUCTION

Time series forecasting can be a challenge as there are several differing strategies you could leverage and several differing hyperparameters for every strategy. The Prophet Library is an open-source library developed for making predictions for univariate time series datasets. It is simple to leverage and developed to automatically identify a good set of hyperparameters for the model in an attempt to make skilful predictions for data with trends and seasonal structure by default.

In this guide, you will find out how to leverage the Facebook Prophet library for time series forecasting. Time series analysis comprises methods for analyzing time series data in order to extract meaningful statistics and other characteristics of the data. Time series forecasting is the use of a model to predict future values based on previously observed values. While regression analysis is often employed in such a way as to test relationships between one or more different time series, this type of analysis is not usually called "time series analysis", which refers in particular to relationships between different points in time within a single series. Interrupted time series analysis is used to detect changes in the evolution of a time series from before to after some intervention which may affect the underlying variable.

Time series analysis is also distinct from spatial data analysis where the observations typically relate to geographical locations (e.g. accounting for house prices by the location as well as the intrinsic characteristics of the houses). A stochastic model for a time series will generally reflect the fact that observations close together in time will be more closely related than observations further apart. In addition, time series models will often make use of the natural one-way ordering of time so that values for a given period will be expressed as deriving in some way from past values, rather than from future values (see time reversibility). Time series analysis can be applied to real-valued, continuous data, discrete numeric data, or discrete symbolic data (i.e. sequences of characters, such as letters and words in the English ).

UG Project Phase-2 involves all the coding and implementation of the design which we have retrieved from UG Project Phase-1. All the implementation is done and conclusions are retrieved in this phase. We will also work on the applications, advantages, and disadvantages of the project in this phase. Future scope of the project will be also discussed in the UG Project Phase-2.

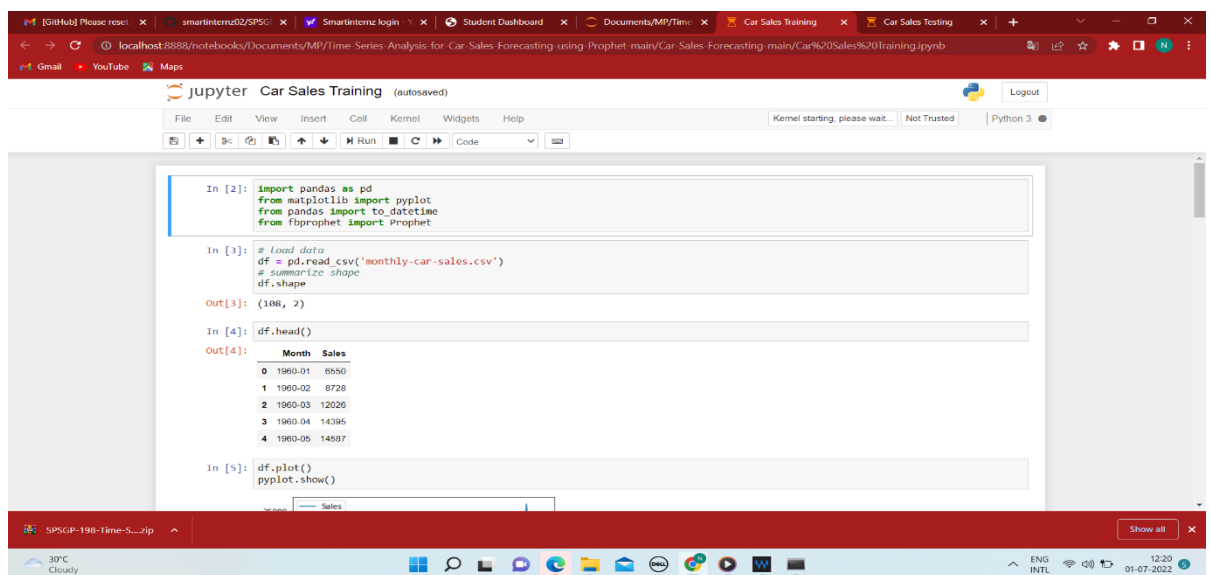

# 1. CODE SNIPPETS

## 2.1. MODEL CODE

### Data Preprocessing

Data Pre-processing includes the following main tasks:

- Importing the required libraries
- Importing the dataset
- Analyze the data
- Resampling the dataset
- Preprocessing the data
- Taking care of Missing Data
- Prophet Library naming convention
- Data visualization

The screenshot shows a Jupyter Notebook titled "Car Sales Training" running on a local host. The notebook contains the following code snippets:

```
In [2]: import pandas as pd
        from matplotlib import pyplot
        from pandas import to_datetime
        from fbprophet import Prophet

In [3]: # Load data
        df = pd.read_csv('monthly-car-sales.csv')
        # summarize shape
        df.shape

Out[3]: (108, 2)

In [4]: df.head()

Out[4]:
```

	Month	Sales
0	1960-01	6550
1	1960-02	8728
2	1960-03	12020
3	1960-04	14395
4	1960-05	14587

```
In [5]: df.plot()
        pyplot.show()
```

The notebook interface includes a menu bar (File, Edit, View, Insert, Cell, Kernel, Widgets, Help), a toolbar with icons for file operations and execution, and a status bar at the bottom showing system information like temperature and time.

Figure 1: .ipynb code describing importing libraries.

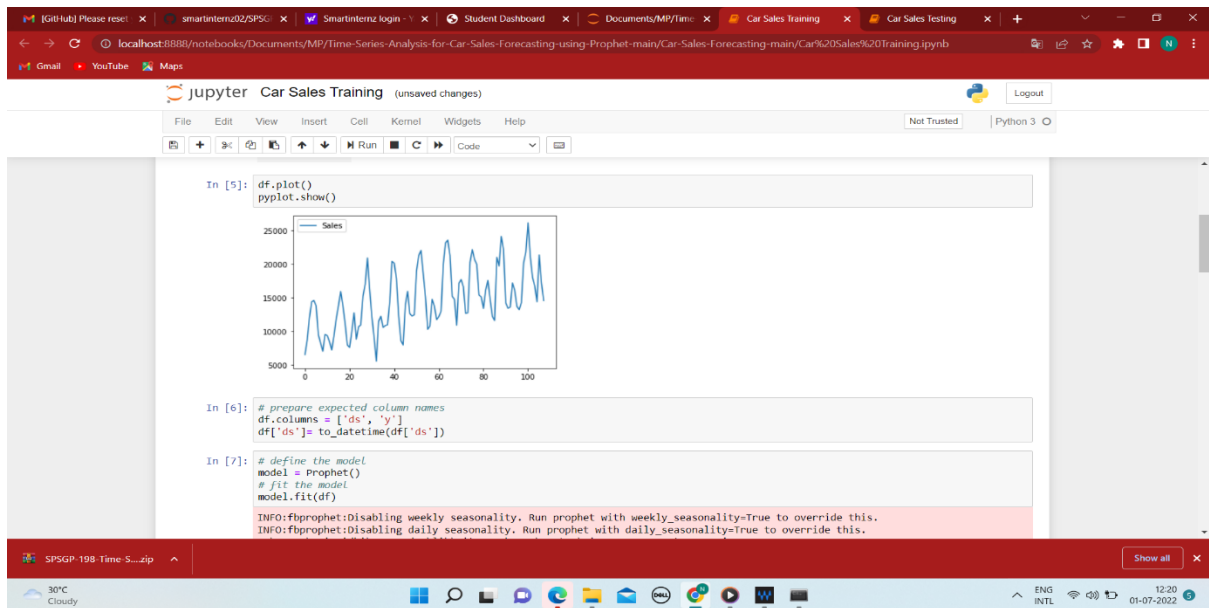

Figure 2: .ipynb code describing Graph.

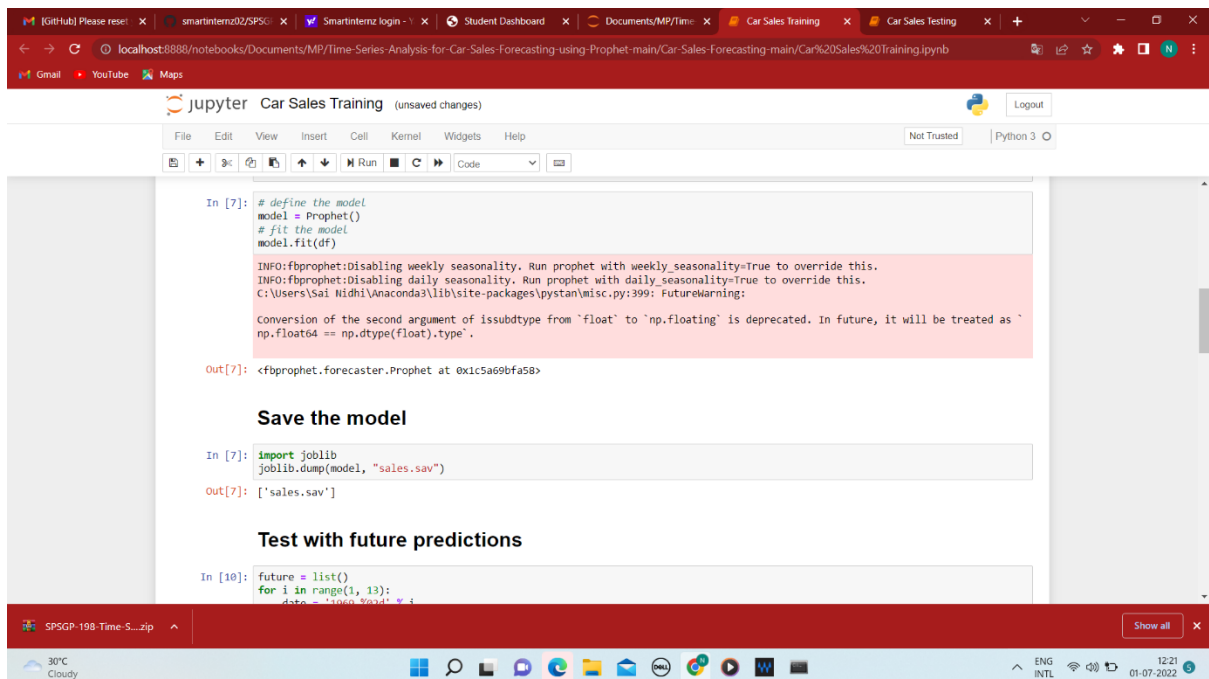

Figure 3: .ipynb code describing the model.

```
In [10]: future = list()
for i in range(1, 13):
    date = '1969-%02d' % i
    print(date)
    future.append([date])
future = pd.DataFrame(future)
future.columns = ['ds']
future['ds'] = to_datetime(future['ds'])

## 2. CONCLUSION

Forecasting of Predicting the value helps the investors to invest in such a time where profits can be maximum. This application helps you in predicting the sale value of a day. It is built on the monthly sales data from 1960-1968. Time series analysis is made on the data for accurate predictions.

### Running Of Flask Application

- Open the anaconda prompt from the start menu.
- Navigate to the folder where your app.py resides.
- Now type the “python app.py” command.
- It will show the local host where your app is running on <http://127.0.0.1:5000/>
- Copy that local host URL and open that URL in the browser. It does navigate you to where you can view your web page.

Your UI will look like

### Forecasting the Car Sales Value

#### Predict the Sale Value

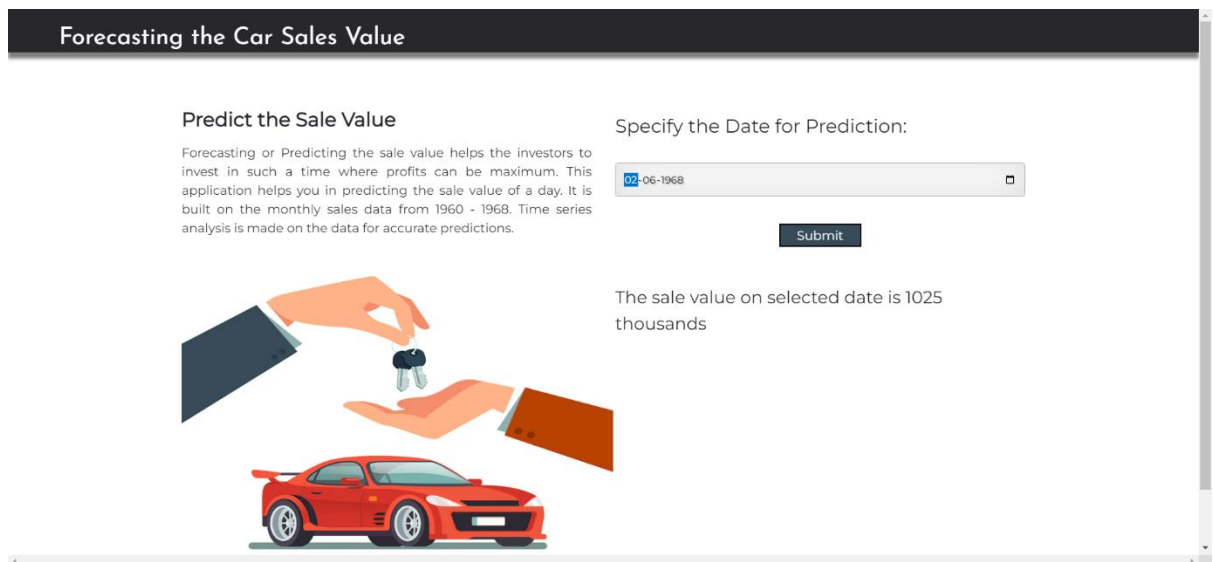

Forecasting or Predicting the sale value helps the investors to invest in such a time where profits can be maximum. This application helps you in predicting the sale value of a day. It is built on the monthly sales data from 1960 - 1968. Time series analysis is made on the data for accurate predictions.

Specify the Date for Prediction:

Submit

**Figure 10: Input page (Which takes inputs from User)**

**Figure 11: Output page(when user enters some particular date it gives result)**

- Select the date you would like to predict and click on submit.
- The output prediction will be like.

## 4. APPLICATIONS

### 1.Time series in Financial and Business Domain

Most financial, investment and business decisions are taken into consideration on the basis of future changes and demands forecasts in the financial domain. Time series analysis and forecasting essential processes for explaining the dynamic and influential behaviour of financial markets. Policymakers and business experts use financial forecasting to make decisions about production, purchases, market sustainability, allocation of resources, etc. In investment, this analysis is employed to track the price fluctuations and price of a security over time. For instance, the price of a security can be recorded;

- For the short term, such as the observation per hour for a business day, and
- For the long term, such as observation at the month end for five years.

Time series analysis is extremely useful to observe how a given asset, security, or economic variable behaves/changes over time.

## **2. Time series in Medical Domain**

Medicine has evolved as a data-driven field and continues to contribute in time series analysis to human knowledge with enormous developments. In the medical domain, it is important to examine the transformation of behaviour over time as compared to derive inferences depending on the absolute values in the time series. For example, to diagnose heart rate variability in occurrence with respiration based on the sensor readings is the characteristic illustration of connecting time series with case-based monitoring.

However, time series in the context of the epidemiology domain has emerged very recently and incrementally as time series analysis approaches demand recordkeeping systems such that records should be connected over time and collected precisely at regular intervals. As soon as the government has placed sufficient scientific instruments to accumulate good and lengthy temporal data, healthcare applications using time series analysis have resulted in huge prognostication for the industry as well as for individuals' health diagnoses.

### Medical Instruments

Time series analysis has made its way into medicine with the advent of medical devices such as

- Electrocardiograms (ECGs), invented in 1901: For diagnosing cardiac conditions by recording the electrical pulses passing through the heart.
- Electroencephalogram (EEG), invented in 1924: For measuring electrical activity/impulses in the brain.

These inventions made more opportunities for medical practitioners to deploy time series for medical diagnosis. With the advent of wearable sensors and smart electronic healthcare devices, now persons can take regular measurements automatically with minimal inputs, resulting in a good collection of longitudinal medical data for both sick and healthy individuals consistently.

## **3. Time Series in Astronomy**

One of the contemporary and modern applications where time series plays a significant role are different areas of astronomy and astrophysics. Being specific in its domain, astronomy hugely relies on plotting objects, trajectories and accurate measurements, and due to the same, astronomical experts are proficient in time series in calibrating instruments and studying objects of their interest. Time series data had an intrinsic impact on knowing and measuring

anything about the universe, it has a long history in the astronomy domain, for example, sunspot time series were recorded in China in 800 BC, which made sunspot data collection as well-recorded natural phenomena.

Similarly, in past centuries, time series analysis was used

- To discover variable stars that are used to surmise stellar distances, and
- To observe transitory events such as supernovae to understand the mechanism of the changing of the universe with time.

Such mechanisms are the results of constant monitoring of live streaming of time series data depending upon the wavelengths and intensities of light that allows astronomers to catch events as they are occurring. In the last few decades, data-driven astronomy introduced novel areas of research as astroinformatics and astrostatistics; these paradigms involve major disciplines such as data mining, machine learning and computational intelligence. And here, the role of time series analysis would be detecting and classifying astronomical objects swiftly along with the characterization of novel phenomena independently.

#### **4. Time series in Forecasting Weather**

Anciently, the Greek philosopher Aristotle researched weather phenomena with the idea to identify causes and effects in weather changes. Later on, scientists started to accumulate weather-related data using the instrument “barometer” to compute the state of atmospheric conditions, they recorded weather-related data on intervals of hourly or daily basis and kept them in different locations. With the time, customized weather forecasts began printed in newspapers and later on with the advancement in technology, currently forecasts are beyond the general weather conditions. In order to conduct atmospheric measurements with computational methods for fast compilations, many governments have established thousands of weather forecasting stations around the world. These stations are equipped with highly functional devices and are interconnected with each other to accumulate weather data at different geographical locations and forecast weather conditions at every bit of time as per requirements.

## 5. Time series in Business Development

Time series forecasting helps businesses to make informed business decisions, as the process analyzes past data patterns it can be useful in forecasting future possibilities and events in the following ways;

- **Reliability:** When the data incorporates a broad spectrum of time intervals in the form of massive observations for a longer time period, time series forecasting is highly reliable. It provides elucidate information by exploiting data observations at various time intervals.
- **Growth:** In order to evaluate the overall financial performance and growth as well as endogenous, time series is the most suitable asset. Basically, endogenous growth is the progress within organizations' internal human capital resulting in economic growth. For example, studying the impact of any policy variables can be manifested by applying time series forecasting.
- **Trend estimation:** Time series methods can be conducted to discover trends, for example, these methods inspect data observations to identify when measurements reflect a decrease or increase in sales of a particular product.
- **Seasonal patterns:** Recorded data points variances could unveil seasonal patterns & fluctuations that act as a base for data forecasting. The obtained information is significant for markets whose products fluctuate seasonally and assist organizations in planning product development and delivery requirements.

## 5. ADVANTAGES

1. Time series forecasting is of high accuracy and simplicity.
2. It can be used to analyze how the changes associated with the data point picked correlate with changes in other variables during the same time span.
3. Statistical techniques have been developed to analyze time series in such a way that the factor that influences the fluctuation of the series may be identified and handled.
4. It can give good output with less variables. As regression models fail with less variables, time series models will work better and effectively.

## **6. DISADVANTAGES**

1. Time series models can easily be overfitted, which lead to false results.
2. It works well with short term forecasting but does not work well with long term forecasting.
3. It is sensible to outliers, if the outliers are not handled properly then it could lead to wrong predictions.
4. The different elements that impact the fluctuations of a series cannot be fully adjusted by the time series analysis.
5. Expensive computation cost.
6. The big challenge is during the training period.

## **7. FUTURE SCOPE**

Time Series forecasting is the use of a model to forecast future events based on known past events to predict data points before they are measured predicting the sale value helps the investors to invest in such a time where profits can be maximum. The scope of time series is huge and so is the field of time series analysis.

## 9.HELP FILE

### **PROJECT EXECUTION (LOCAL ENVIRO→NMENT):**

**STEP-1:** go to **Start**, search and launch **ANACONDA NAVIGATOR**.

**STEP-2:** After launching of **ANACONDA NAVIGATOR**, launch **JUPYTER Notebook**, Open "**Major project Code**" **IPYNB file** then run all cells, a pickle file will be generated.

**STEP-3:** Create a folder named **FLASK** on the **DESKTOP**. Extract the pickle file into this Flask Folder.

**STEP-4:** Extract the html file (Predict.html) and python file (app.py, temp.py) into the **FLASK Folder**.

**STEP-5:** Then go back to **ANACONDA NAVIGATOR** and the launch the **SPYDER**.

**STEP-6:** After launching Spyder, give the path of **FLASK FOLDER** which you have created on the **DESKTOP**.

**STEP-7:** Open all the app.py, temp.py and html file present in the Flask Folder.

**STEP-8:** After running of the app.py, open **ANACONDA PROMPT** and follow the below Steps:

cd File path →click enter

python app.py →click enter (We could see running of files).

**STEP-9:** Then open **BROWSER**, at the URL area type---"**localhost:5000**".

**STEP-10:** Home page of the project will be displayed.

**STEP-11:** Here Forecasting the Car Sales Value page is displayed, we can predict the sale value of a day.

**STEP-12:** Then gives Specify the Date for Prediction in the format of DD-MM-YYYY or select from the Calender. Now Click on "**SUBMIT**".
